# Garden Center Structures by Hendee Enterprises, Inc. *The Innovative Solutions Company*

## **Fabric Greenhouse Gable**

Increase store visibility with attractive gable styling. Provides protection for both plants and customers. Structure design will support lighting and sprinkler systems. Structure is designed to withstand 120 mph. wind loads, as well as provide a 20 psf liveload. Backlit signage pulls in night traffic.

## **Fabric Greenhouse Hoop**

Provides an effective alternative to traditional glass greenhouses at a fraction of the cost. This system allows extended selling seasons, additional merchandising space, and an inviting atmosphere for your customers. 53% translucent fabric provides for sufficient light levels.

## **Triangular Truss**

Designed to provide maximum merchandising space. Panels are attached with springs for easy installation and removal of shade cloth. Aluminum components and galvanized columns ensure years of maintenance free usage.

## **Warren Truss**

System design allows for increased column spacing over the conventional pipe frame system typically used in garden centers providing an economical alternative for shading your merchandising areas. Enduro® shade panels attach to truss using lace cord.

## Irrigation

Designed to effectively water the garden center area without the use of hoses or other methods. Watering is controlled through the use of a Toro II low voltage controller. The watering times and zones can be preset to allow watering at any time. Greater watering efficiency is gained through the use of directional spray nozzles that produce a course, wide angle pattern with a total nozzle adjustment angle of 45°.

## Roll-Ups

Gear operated curtains allow the ability to effectively enclose the garden center area during times of inclement weather. Once lowered, velcro flaps secure curtains together to reduce the amount of wind and rain from penetrating the garden shop area. Fabricated with 20 gauge clear vinyl windows and 16 ounce vinyl tri-laminate borders.

## Windscreen

Provides an effective wind break and weather protection for both plants and customers in the garden center. Also provides additional shading for areas that receive direct sunlight. Shade cloth is easily attached to all types of fencing by either tie straps or lacing cord. Coordinates the look of the shade structure and the fencing.

## Plant Hangers

An all carbon steel frame supports plant and flower pots for product display. This innovative approach to merchandising will increase the amount of floor space available for other products while utilizing column lines for additional displays. The plant hanger is designed to display more product to the customer and increase the earning potential of your garden center.
